

Relay control using Zennio IR Remote

1. The actuator ACTinBOX Classic incorporates in its design an infrared receiver

The actuator ACTinBOX Classic includes the possibility to test the OUTPUT from the infrared remote control (the same which is used to control the Z38 touch screen)

To control the OUTPUT from the IR remote, it is necessary to have programming LED lit.

- Right Button => Close the corresponding output relay
- Left Button => Open the corresponding output relay

- It's only an output test of the actuator, none of its parameterized functions (timer, scene...) are taken into account at the moment to open and close relays.
- Serial number from which this feature is included.

- **09AAD**

**VERY IMPORTANT => For channels configured as shutter channel:
NEVER close two relay of same shutter channel at the same time, high risk damaging the engine component.**
